

Benefits of Obtaining information for planning With noninvasive FFR_{CT} prior to Invasive Evaluation- The BOWIE study

Eric Van Belle, MD PhD, Luis Raposo MD, Sergio Bravo Baptista MD PhD,
Flavien Vincent, MD PhD, Sina Porouchani MD, Alessandro Cosenza MD,
Campbell Rogers MD, Jonathon Leipsic MD

- Despite an apparently well-conducted PCI procedure, ischemia is not relieved in 15-30% of patients and is associated with a 3-fold increase of MACE.^{1,2}
- Ideally, this issue should be identified up-front, in order to adapt the procedure and achieve a proper relief of ischemia.
- FFR_{CT} is a highly accurate test for the discrimination of lesion-specific ischemia. Recently, the ability to model post-treatment FFR_{CT} has been developed.
- The real-time, interactive FFR_{CT} planner* (HeartFlow, Inc.) is a novel non-invasive revascularization planning tool intended to help determine optimal CAD treatment decisions by facilitating the virtual modeling of treatment and calculation of post-treatment FFR_{CT}.

*Not yet commercially
available, pending
Regulatory Review

To determine the impact of the interactive FFR_{CT} planner, as compared to Invasive Coronary Angiography (ICA) alone, on CAD treatment decision making.

- Primary Endpoint: Reclassification
Differences between the ICA-based and FFR_{CT}– based treatment plans *per patient, per vessel, and per lesion*
- Secondary Endpoints:
Usage of invasive physiology
Nature of the treatment plan change

Pre-procedure evaluation of alternate treatment strategies to optimize coronary flow

- Real-time non-invasive interactive tool
- Explore different clinical scenarios by virtually removing stenoses
- Assess resulting FFR_{CT} value(s) from any scenario

*Not yet commercially available, pending Regulatory Review

1

Starts with the HeartFlow Analysis

Interactive Mobile Platform

- iOS, interactive viewer

2

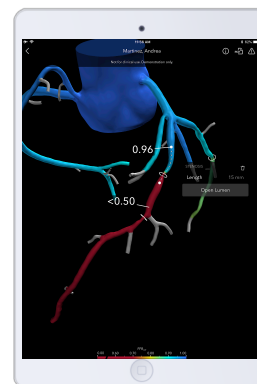

3

Ideal Geometry

- Contains a second anatomic model representing the “ideal” vessel

HeartFlow Planner

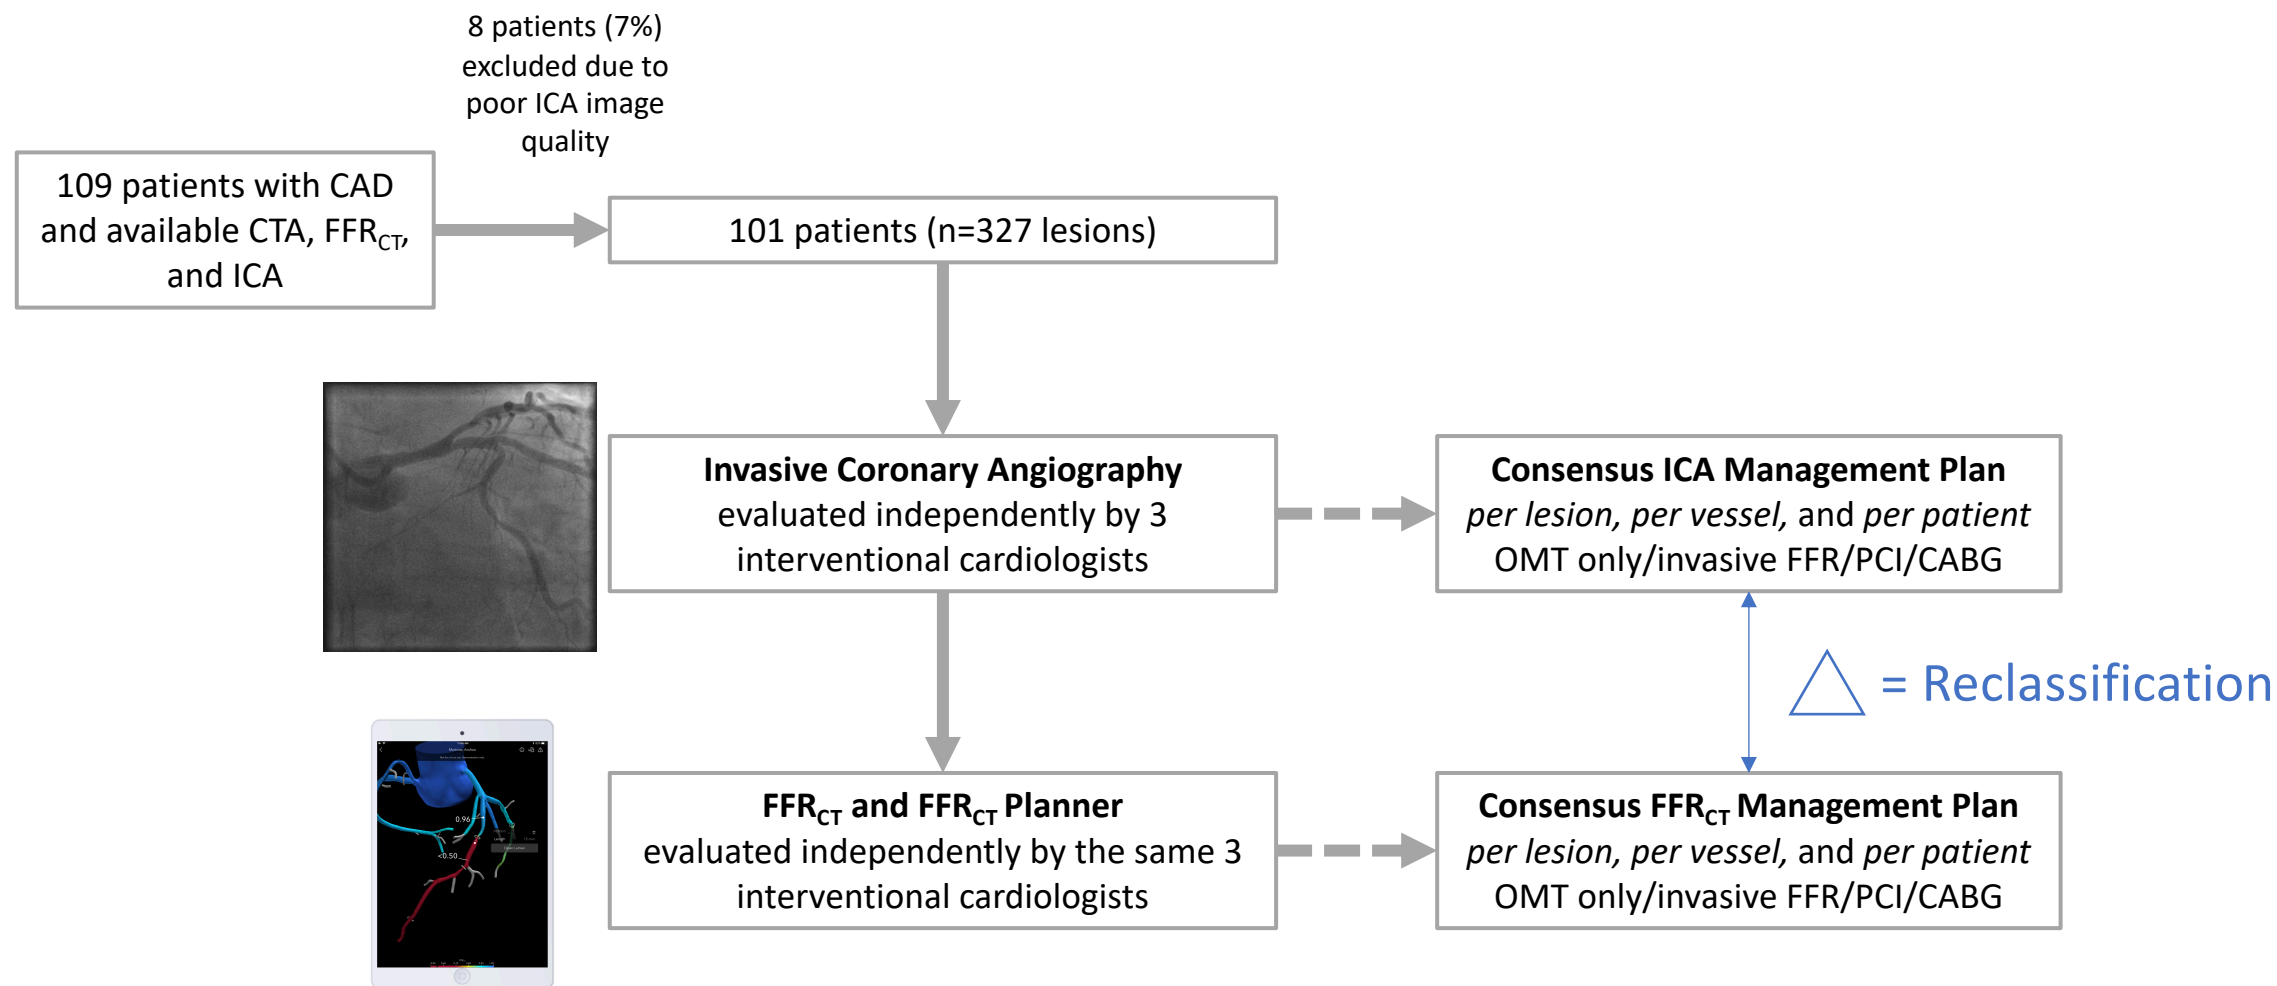

Real-time FFR_{CT} calculation

- Modified vessel combined with updated physiology

4

How was the study executed?

- 101 patients, 327 stenoses
- Mean number of stenoses: 3.2 ± 1.6 per patient
- **Serial stenoses (≥ 2 lesions in a row in the same territory) were present in 81% on ICA**
- Baseline distal FFR_{CT} values were lower in LAD, as compared with LCX and RCA territories (0.62 ± 0.17 , 0.68 ± 0.18 , 0.80 ± 0.13 respectively; $p=0.001$)

Reclassification rates per lesion and per patient

Lesion level (n=327)

No Reclassification

Patient level (n=101)

Reclassified by FFR_{CT} Planner

Reclassification rates by lesion complexity

Single Lesion

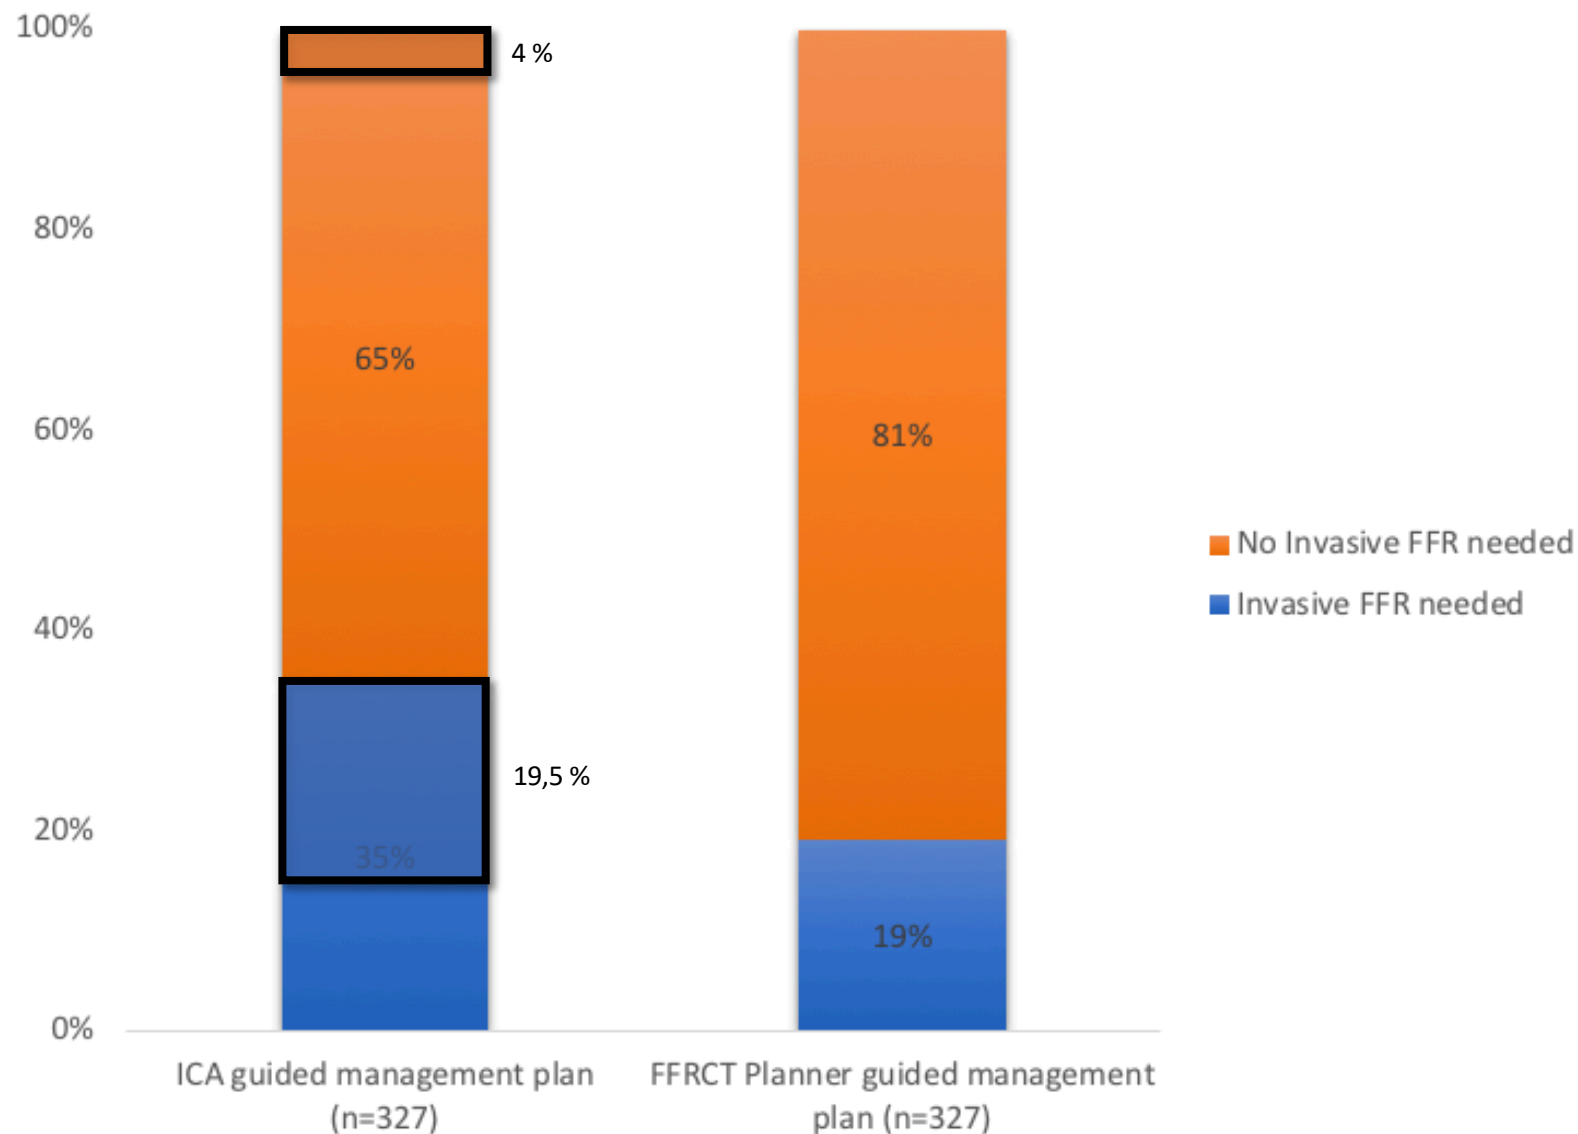

No Reclassification

Serial Lesions

Reclassified by FFR_{CT} Planner

Change of physiology usage by FFR_{CT} Planner

ICA-Guided Management Plan

Optimal Medical Therapy (OMT) *n=84 lesions*

Invasive FFR Needed *n=113 lesions*

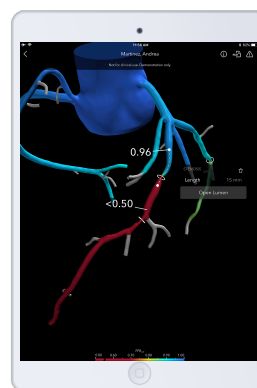

PCI *n=105 lesions*

CABG *n=25 lesions*

FFR_{CT} Planner

Treatment plans
were altered for
31% of lesions

FFR_{CT} Planner-Guided Management Plan

Optimal Medical Therapy (OMT) *n=113 lesions*

Invasive FFR Needed *n=62 lesions*

PCI *n=119 lesions*

CABG *n=33 lesions*

Reclassification rates by ICA-based management plan

ICA-based plan: PCI (n=66)

No Revasc (n=28)

CABG (n=7)

No Reclassification

Reclassified by FFR_{CT} Planner

Non-invasive interactive FFR_{CT} Planner reclassifies the “PCI strategy”

Pre-PCI

ICA

FFR_{CT} Planner

Post-PCI

Reduced stent length using FFR_{CT} Planner strategy yielded similar physiologic result as ICA-based plan

- In patients with coronary artery disease, the use of the interactive FFR_{CT} planner prior to invasive angiography may:
 - Change the revascularization strategy in **31% of lesions and 45% of patients**
 - Reduce the need for invasive physiology
 - Not reduce the rate of PCI but **change the PCI strategy in 50% of cases**
- The results emphasize the potential benefit of the use of a real-time interactive FFR_{CT} planner pre-angiography to help inform revascularization decision making, optimize completeness of revascularization, and streamline resource utilization among CAD patients.
